

Visual Product Matcher

by Manish Poudel | MCA, VIT Vellore

Objective:

Develop a web application with an interactive user interface that identifies visually similar products by leveraging CLIP-based image embeddings and cosine similarity metrics.

System Architecture:

- **Frontend & Backend:** Streamlit – Unified framework for image upload (file/URL), similarity computation, result display, and interactive filtering.
- **Embedding Model:** CLIP (ViT-B-32) via Sentence Transformers – Generates 512-dimensional vector embeddings for images using vision-language pre-training.
- **Similarity Metric:** Cosine Similarity – Computes vector distance to find nearest product matches.
- **Data Storage:** JSON File – Stores pre-computed product metadata and embedding vectors.
- **Image Processing:** PIL (Pillow) – Handles image loading, resizing, and EXIF orientation correction.
- **Deployment:** Streamlit Cloud / Local Server

Workflow:

1. User uploads an image (JPG/PNG/AVIF) or provides a URL.
2. Application loads and displays the uploaded image (resized to 300×300px).
3. User adjusts minimum similarity threshold using an interactive slider (0-100%).
4. On button click, CLIP model generates embedding vector for the input image.
5. System computes cosine similarity against all stored product vectors.
6. Returns top 5 matches and filters results based on user-defined threshold.
7. Frontend displays filtered products in a 3-column grid layout with similarity scores.
8. Shows warning if no products meet the similarity threshold.
